

“I am very impressed  
with your product!!  
Bravo.”

## Syslore Customer Case Study (undisclosed customer): Automatic Data Matching Solution

### The Problem

Syslore customer had lots of inconsistent report and transaction data in their databases and information systems. This information had been generated during several years and the amount of information was growing constantly. The core problem was that the data could not be recognized without manual intervention in the matching process between data reports and actual address and location data.

### The Solution

The customer’s goal was to automatically match inexact transaction files against address reference database in order to get them matched with real locations. This process would lead to a significantly reduced manual matching work, i.e. lower costs. After a benchmark test between several data matching tools, the customer concluded that the Syslore solution could provide an automatic data matching solution to their problem with excellent results. Customer’s comment clearly describes the performance of Syslore software: “I am very impressed with your product!! Bravo.”

### About Syslore IAL

Syslore IAL (Intelligent Address Lookup) offers a scalable solution for error-tolerant matching across multiple database columns with multiple simultaneous errors in either the database or search string.
